

Leveler Kit Operation

An integrated feature of the GearWagon 125 Camper (aka GearLodge).

The Leveler Kit is for stabilization of the trailer when unconnected from a vehicle.

Operation

- To extend legs, pull leg outward to release the spring catch and detent lance. Allow the leg to swing downward until the lance engages in the extended slot position.
- To retract legs, first minimize the leg length to the shortest position, then pull leg downward to release the lance from its extended and locked position. Swing the leg upward into the retracted position until the lance catches in the retracted slot. Before driving, verify that the legs are retracted and that the locking lance is fully engaged in the locking slot.

To release from catch position, pull leveler forward (toward front of trailer).

Swing leveler down.

Adjust height by pressing downward on adjustment lever.

To prepare for transit, release adjustment lever to minimize leg length and fold upward to retracted, caught position shown above.

WARNING: Always fold up Leveler Kit in secure position before operating trailer. Do not move trailer with stabilizers down, or damage will occur.
